

Simple, powerful social.

Coho is built for people who want Mastodon to feel calm, instant, and dependable on any device and any network.

Why people choose Coho

- Works when the connection is weak or completely offline.
- Install once and use it across iOS, Android, Windows, macOS, and Linux.
- Optimistic UI keeps your flow moving instead of waiting on network round trips.
- Modern PWA architecture gives native quality behavior in a smaller footprint.

Offline that actually works

Your timeline stays available. Likes, boosts, and posts are captured offline and sync automatically when you reconnect.

Fast on old phones and bad networks

Strict lazy loading, worker offloading, and smart caching keep interactions responsive instead of stalling the UI.

Clean design without losing power

A focused interface keeps noise low while still giving power users the tools they need.

Built for real-world conditions

Coho is engineered for unreliable networks and lower-end devices, so everyday usage still feels instant and stable.

Offline actions queue and replay automatically.

Lazy loading and worker offloading keep frame times steady.

No polling loops. Event-driven updates by design.

CORE PROMISE

Network does not control your UX

DESIGN GOAL

No clutter. No pop-in. Just flow.

"Coho keeps the interface calm and responsive so you can focus on people and ideas, not loading states."
